a- 1208 SEQ x64 VST2/VST3 Alpha -

Please help me test this alpha stage EQ plugin. It was built using the newest 64 bit version of SynthEdit. The 64 bit version of SynthEdit is still relativley new so you may experience some bugs, depending on your system.

This is a simple to use 4 band parametric equalizer with switchable high and low curves, a high pass filter and optional saturation. The GUI, frequency ranges , gain levels and Q's are loosely based on a classic British EQ. It also is x4 oversampled to improve quality.

It has been tested using the current versions of Studio One, Cubase, Reaper, Sonar, Mixbus & Ableton Live.

I would really appreciate hearing any overall suggestions, bugs or performance issues.

Known Bugs:

- In Studio One 3.6.4 x64 the VST3 version can’t be bypassed via S1 plugin panel. You can use the plugin “On” button instead.
